

Premise Based VOIP Systems VS Cloud VOIP (Hosted) Services (Version 1: 2/2017)

Outlined below is a diagram illustrating how cloud telephony has evolved from previous business models and its alignment with the stages of technology evolution. Although cloud telephony is deployed through new VOIP technology originating from the internet (cloud) through a third party data center, its business model basically duplicates the original Bell System service model of sole provider for all services and equipment at a reoccurring monthly rental (subscription) fee. Premise VOIP solutions through authorized manufacturer dealers however are built on the financial benefits clearly established by the interconnect industry in the 70's based on the ownership (purchase/lease) model plus the advantages of new VOIP technology and the confidence of premise reliability, security, hardware and software management.

ComNet Solutions: Industry Evolution and Experience

ComNet Solutions puts the Communications into Information and Communications Technology (ICT) by offering premise legacy analog migration, state-of-the art digital, leading-edge VOIP technology, and hybrid or emerging cloud telephony solutions to meet the needs of any size or type (vertical market) of business based upon their business model of choice. The dedicated **ComNet** team is positioned to meet your toughest business voice and data technology needs through global leading industry supplier relationships and over 40 years of industry experience and customer commitment. Many of the **ComNet** employees have evolved with the industry and have a keen insight of the current environment to help business owners, decision makers and influences make the most cost-effective decision and safest technology investment.
